# Quadriderm<sup>®</sup> Cream 15g

With anti-bacterial and anti-fungal properties

## YOUR 4-IN-1 SOLUTION TO DERMATOLOGICAL CONDITIONS OF UNKNOWN AETIOLOGY

Quadriderm is a topical corticosteroid containing **anti-infective agents**.

It is a **broad-spectrum antibiotic topical dermatological preparation** that provides a complete range of therapy in treating large numbers of dermatological conditions.

**Quadriderm is indicated where the causative agent is unknown.**

### QUADRIDERM PROPERTIES:

- ✓ Anti-inflammatory
- ✓ Anti-fungal
- ✓ Anti-bacterial
- ✓ Anti-pruritic

### EACH GRAM CONTAINS:

Betamethasone (as 17 – valerate)	0,5 mg
Gentamicin (as sulphate)	1,0 mg
Tolnaftate	10,0 mg
Clioquinol	10,0 mg

### INDICATIONS:

- Treatment of a wide variety of eczemas
- Inflammatory steroid-responsive dermatoses, including pruritis
- Where secondary bacterial and/or fungal infection may be present or threatens

This multiple therapy approach can therefore be combined into one therapy which is **cost-effective** and **safe** for patients.

### WARNING:

Treatment is not indefinite. If the condition worsens or does not show signs of improvement after 7 days, it is recommended that you investigate further.
